DETAILED ACTION

Priority

Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the parent case of this application.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 3 and 6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Miller et al. '663 in view of Calamito.

Miller teaches a woven multi-layer angle interlock (3-D, 5 axial) fabric. Referring to figs. 3 and 4, Miller clearly shows a divisibly woven section, that is cut in the longitudinal direction along a center line. The flaps 74 and 76, of the fabric can be bent to virtually any orientation desired relative to the remainder of the fabric. When bent to an angle of approximately 90 degrees relative to the remainder of the fabric as shown in Fig. 4 and then stiffened (I-beam manufacture), the flaps 74, 76, are particularly useful in preventing flexure of the fabric along the length (col. 8, lines 1-9).

As for the recitation that there be "at least two" divisible sections, without any recitation as to the criticality or unexpected results from this limitation, the examiner holds that one of ordinary skill in the art could determine through routine experimentation the ideal number of divisible sections needed for a given application.

Art Unit: 3765

Additionally, Calamito teaches a multi-layer angle interlock fabric that uses a plurality of divisibly woven sections, which are used to form complex shapes for the production of structural composites.

Therefore it would have been obvious to one of ordinary skill in the art at the time of invention to use more than one divisibly woven section in the fabric of Miller to aid in the manufacture of I-shaped structural members.

Response to Arguments

Applicant's arguments with respect to claims 3 and 6 have been considered but are moot in view of the new ground(s) of rejection.
